About SolarEdge

About us

In 2006, SolarEdge invented an intelligent inverter solution that has changed the way power is harvested and managed in PV systems. Today, we are a global leader in smart energy technology. By deploying world-class engineering capabilities and with a relentless focus on innovation, we create smart energy products and solutions that power our lives and drive future progress.

Vision

We believe that continuous improvement in the ways we produce and consume energy will lead to a better future for us all

Bankability

- SolarEdge has been audited and approved by major banks and financial institutions for projects and funds worldwide
- SolarEdge (SEDG) is traded on NASDAQ
- Our financial strength and stability, combined with our cutting-edge technology, has propelled us to become one of the largest inverter manufacturers in the world

Global reach

- Systems installed in over 130 countries across five continents
- Sales via leading integrators and distributors
- Follow the sun call centers
- Local teams of sales, service, marketing, and training experts
- Global manufacturing capabilities with tier 1 electronic manufacturing service companies

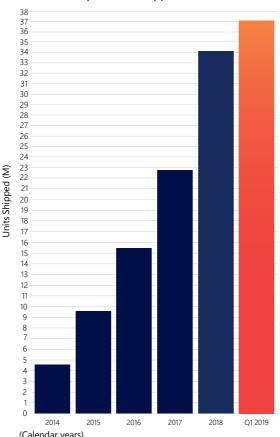

Received nearly 30 awards from prestigious organisations including Red Herring, Frost & Sullivan, Intersolar, the Stratus Award, and the Edison Awards™

Shipping since 2010

- Over 1.5 million inverters shipped worldwide
- SolarEdge's monitoring platform continuously tracks hundreds of thousands of installations across the globe

Power optimisers shipped (cumulative)

Corporate social responsibility

- As an industry leader in renewable energy technologies, SolarEdge strives to limit the harmful effects of traditional energy sources by promoting the spread of clean, sustainable energy around the world
- SolarEdge is in full compliance with international standards on quality and control, ethical conduct and environmental protection

Patents

SolarEdge has a vast portfolio of intellectual property, with hundreds of awarded patents and patent applications

Product reliability

- 25-year power optimiser warranty and 7-year inverter warranty, extendable to 20 years
- SolarEdge products and components undergo rigorous testing, and have been evaluated in accelerated life chambers
- Reliability strategy includes proprietary application specific ICs (ASIC)

4 | SolarEdge Commercial Offering (Calendar years)

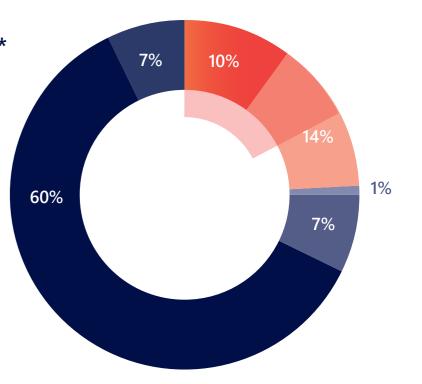

The Importance of Inverter Selection

Commercial rooftop installation cost breakdown*

Inverters account for less than 10% of the system cost but,

- Manage 100% of system production
- Influence up to 20% of system cost
- Control O&M expenses through PV asset management solutions

Therefore, the inverter selection is critical for the long term financial performance of a PV system as it can maximise energy production and reduce lifetime costs.

Maximum Energy Yield in Commercial Installations

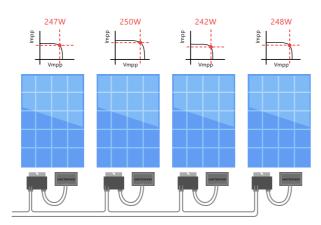

Unavoidable in commercial installations, panel-level mismatch occurs when panels in a string have different Maximum Power Points (MPPs). Arising from a variety of sources, the mismatch decreases the energy yield of the entire string.

Traditional string inverter

- MPPT per string all panels operate at same current, regardless of their individual MPP
- Weak panels reduce the performance of all panels in the string or are bypassed
- Power losses due to panel mismatch

SolarEdge DC optimised inverter solution

- Panel-level MPPT current & voltage adjusted at the panel level
- Maximum power produced and tracked from each panel individually
- 2%-10% more energy from the PV system

The SolarEdge DC optimised inverter solution mitigates power losses caused by panel mismatch for maximum power generation from each panel. With SolarEdge, strong panels are not affected by the weaker ones.

Examples of power mismatch in commercial installations:

Manufacturing tolerance mismatch

The panel manufacturer-warranted output power range may vary greatly. A standard deviation of 3% is sufficient to result in ~2% energy loss.

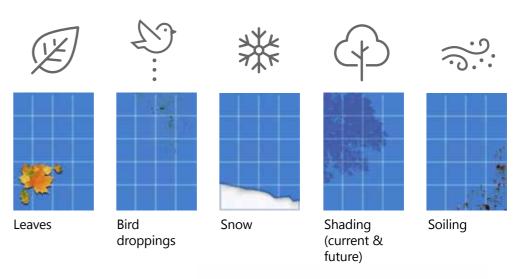

Guaranteed power output from panel manufacturers 0~+3%

Soiling, shading & leaves

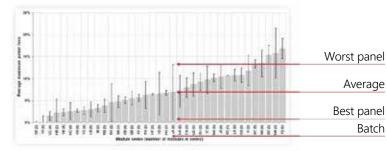

Panel soiling, from dirt, bird droppings or snow, contributes to mismatch between panels and strings.

While there may be no obstructions during site design, throughout a system's lifetime, a tree may grow or a structure may be erected that creates uneven shading.

Uneven panel aging

Panel performance can degrade up to 20% over 20 years, however, each panel ages at a different rate, which causes aging mismatch.

Source: A. Skoczek et. al., "The results of performance measurements of field-aged c-Si photovoltaic panels", Prog. Photovolt: Res. Appl. 2009; 17:227–240

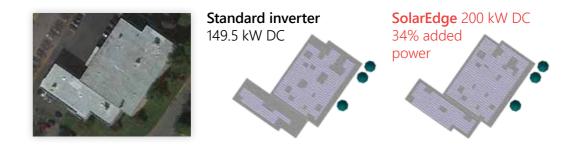

Design Flexibility

More power

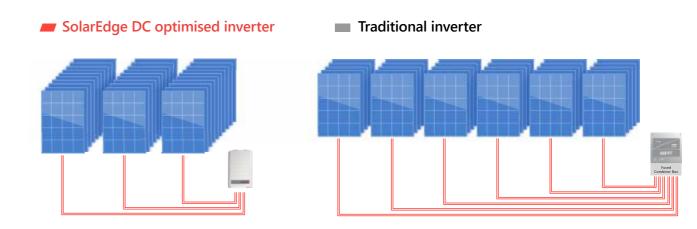

With panel-level power optimization and maximum design flexibility, more panels can be installed on the roof, enabling a shorter project payback period SolarEdge power optimisers enable installation of:

- Panels in partially shaded areas
- Strings of uneven lengths
- Strings in multiple orientations and different roof facets

Reduced BoS cost

Up to 15kW per string allows for more panels per string. This leads to fewer strings per inverter and therefore less wiring, combiner boxes, and fuses

PV Asset Management with **Panel-Level Monitoring**

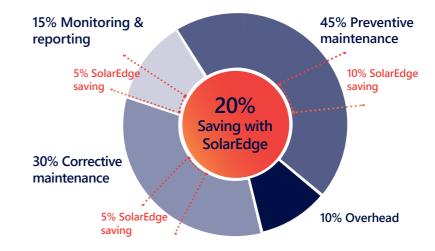

As equipment prices drop and system sizes trend upward, PV projects are increasingly seen as secure long-term investment opportunities. Like any financial asset, PV systems must be monitored and managed to realize their full potential.

Traditional inverters offer limited information, such as string-level or system-level monitoring that can indicate underperformance of the array, but little else. It then becomes costly and time consuming to send skilled technicians to perform on site troubleshooting.

The SolarEdge DC optimised inverter solution offers advanced PV monitoring and asset management. Power optimisers constantly track MPP and report high-resolution data on panel performance.

The SolarEdge monitoring platform transforms O&M from a manual, resource-intensive process to an automated, at-a-glance service, ensuring that every plant is performing to the best of its ability at all times.

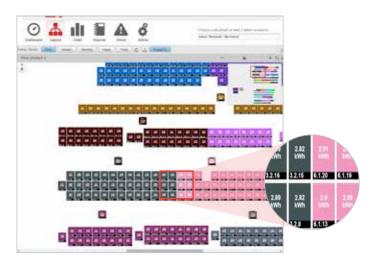

PV Asset Management with Panel-Level Monitoring (cont.)

SolarEdge's monitoring platform features:

1. Real-time remote monitoring at the panel, string, and system levels

The logical layout displays the electrical connectivity between panels, strings and inverter

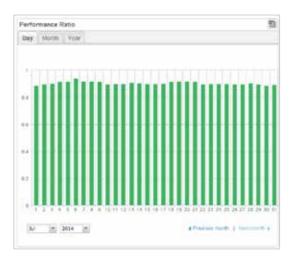

The hierarchy layout displays grouping of components per inverter

2. Comprehensive analytics tracking and reports of energy yield, system uptime, performance ratio, and financial performance

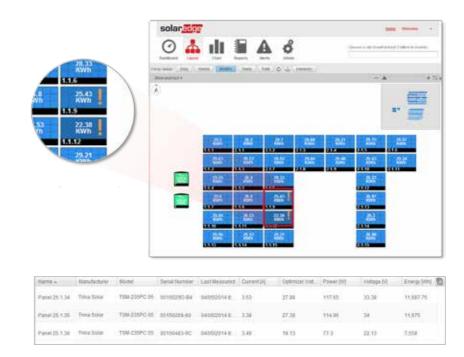

Dashboard - Energy production is displayed with weekly, monthly and yearly resolution

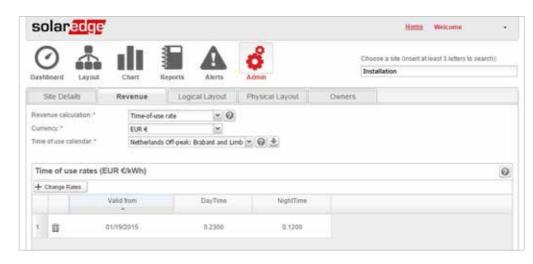

Performance Ratio - Analyze and track the system's performance ratio using satellite data or onsite sensors

3. Pinpointed and automatic alerts for immediate fault detection, accurate maintenance, and rapid response. The alerts show the specific fault location, fault description, and fault status. Energy thresholds alerts can be set to detect underperforming panels. Custom settings available for time of day and offset from sunrise and sunset.

4. The time-of-use feature allows system owners to define peak and off-peak rates in order to track expected PV revenue. This may be used as an indication of the systems ROI.

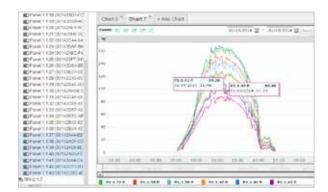

PV Asset Management with Panel-Level Monitoring (cont.)

5. Accurate and remote troubleshooting for fast and efficient resolution with minimal and shortened onsite visits. Examples of identifying underperforming panels:

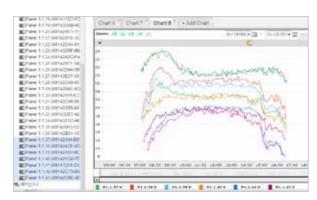

Soiling

Potential induced degradation (PID)

Looking at the panels within one string, it is possible to see the power degradation increasing towards the negative pole.

No need to send technicians to the roof –panel voltage is measured remotely

Bypass diode failure

It is easy to identify the bypass diode failure with the panel-level voltage graphs. The faulty panel outputs at only 2/3 of the voltage (5/6 in this case of power optimiser connected to two panels).

6. The consumption monitoring feature shows data about electricity consumption, PV production, and self-consumption. This feature is integrated into all SolarEdge inverters and requires only a connection of a SolarEdge energy meter.

Superior Safety

With millions of photovoltaic (PV) systems installed worldwide, this technology is designed to be relatively safe and reliable. However, as traditional PV installations can reach voltages as high as 1,500VDC, precautions should be taken to ensure the safety of people and assets. With traditional inverters, shutting down the inverter or the grid connection will terminate current flow, but DC voltage in the string cables will stay high for as long as the sun is shining. In addition, electrical arcs, which can result in a fire, create a threat to people and assets in the vicinity of the PV system.

The SolarEdge system provides a superior safety solution for both electrocution and fire risks.

SafeDC™

SafeDC™ is a built-in panel-level safety feature which minimises electrocution risk.

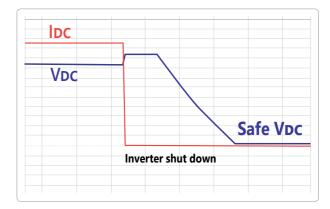

To maintain string voltage below risk levels, power optimisers are designed to automatically switch into safety mode, in which the output voltage of each panel will be reduced to 1V in either of these cases:

- During installation, when string is disconnected from the inverter, or the inverter is turned off
- During maintenance or emergency, when the inverter or AC connection is shut down
- When the thermal sensors of the power optimisers detect a temperature above 85 °C

The SolarEdge SafeDC™ feature is certified in Europe as a DC disconnect according to IEC/EN 60947-1 and IEC/EN 60947-3 and to the safety standards VDE AR 2100-712 and OVE R-11-1.

Arc fault detection and interruption

SolarEdge inverters have a built-in protection designed to mitigate the effects of some arcing faults that may pose a risk of fire, in compliance with the UL1699B arc detection standard. Currently there is no comparable arc detection standard in the EU and therefore non-US SolarEdge inverters can detect and interrupt arcs as defined by the UL1699B standard. In addition to manual restart, a mechanism for autoreconnect can be enabled during system commissioning.

This graph represents an automatic string shutdown.

As demonstrated, the current is shut down immediately once AC power or Inverter is turned off. The string voltage is reduced to safe voltage.

Future Compatibility & Warranty

As part of PV asset management planning, it is important to account for future costs that can impact the return on investment of a PV system. The SolarEdge DC optimized inverter solution effectively minimises these potential costs.

Forward compatibility eliminates expensive stock of spare panel inventory.

- Replacement: SolarEdge allows panels of different power classes and brands in the same string.
- Expansion: New power optimisers can be utilised in the same string with older models.

SolarEdge offers 25-year power optimiser warranty, 7-year inverter warranty, and free monitoring for 25 years. SolarEdge offers extended warranties at attractive prices.

Power optimisers 600W-850W

Three phase inverters 15kVA-100kVA

Monitoring platform

SolarEdge provides low-cost inverter replacement out of warranty

~40% less than traditional inverters

Products are certified for ammonia resistance - suitable for agricultural areas

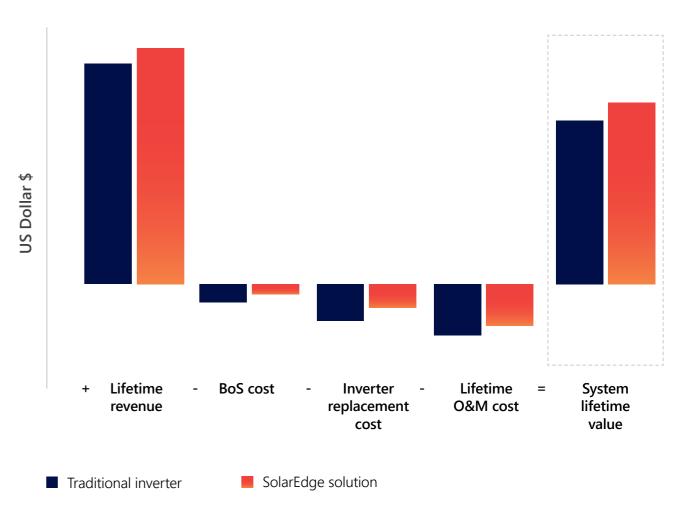

A Higher Lifetime Value

The SolarEdge DC optimised inverter solution offers a better LCOE for a system's lifetime by maximizing yield and reducing costs.

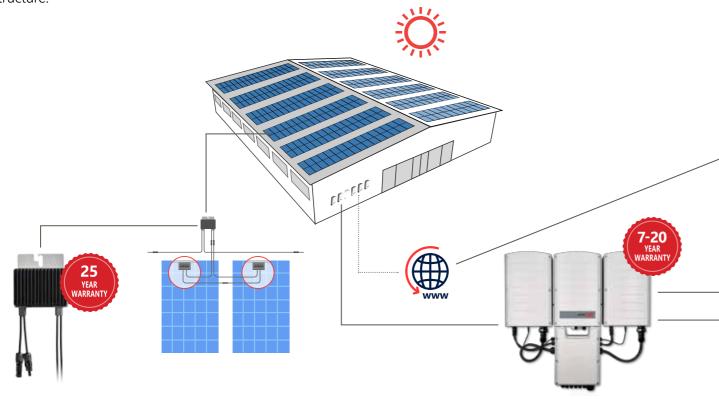

The SolarEdge DC optimised inverter solution maximises power generation at the individual panel level, which leads to a higher lifetime revenue from PV systems. While the initial cost of the SolarEdge solution is generally slightly higher than the equivalent traditional inverter system, the total installation cost as well as the lifetime maintenance cost is lower. This makes the SolarEdge solution more economically

Lifetime PV system cost and revenue

Commercial System Diagram

The SolarEdge solution consists of inverters, power optimisers, and a monitoring platform. The technology provides superior power harvesting and panel management by connecting power optimisers at the panel level. The ability to connect two panels to one optimiser, combined with DC to AC conversion and grid interaction being centralized at a simplified PV inverter maintains a competitive cost structure.

P600-P850 2-to-1 power optimiser configuration

- Panel-level MPPT no mismatch power losses
- Strings of uneven lengths, panels on multiple azimuths & tilts
- Compatible with SolarEdge inverters SE15K &
- SafeDC[™] automatic panel-level safety shutdown

15kVA-100kVA inverter

- Specifically designed to work with power optimisers
- Superior efficiency
- Easy installation, including 2-person install for large capacity models
- Easy, step-by-step inverter activation and commissioning with the SetApp mobile application
- Built-in communication hardware, with optional cellular plug-in
- Optional integrated DC Safety Switch
- Embedded export limitation
- Built-in RS485 SPD plug-in to better withstand surge events (on units $\geq 50kVA$)

Monitoring platform

- Full visibility of system performance
- Remote troubleshooting
- Access via browser or any Android, iOS smart phone or tablet
- Communication with the power optimisers over existing DC power lines (PLC)

- Can be added to the PV system to provide centralised safety management
- Gives real-time indication of the system's DC

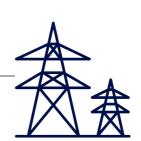

Performance monitoring

Calculate site performance ratio and measure environmental conditions, using environmental sensors or a satellite-based service.

Grid interaction

Supports power control, e.g. zero export limitation, local and remote active/reactive power control, inverter AC relay control for secondary grid protection; low voltage and frequency ride through.

300kW Rooftop System Comparison

Comparison of a 300kWp SolarEdge system to an identical system with a traditional string inverter

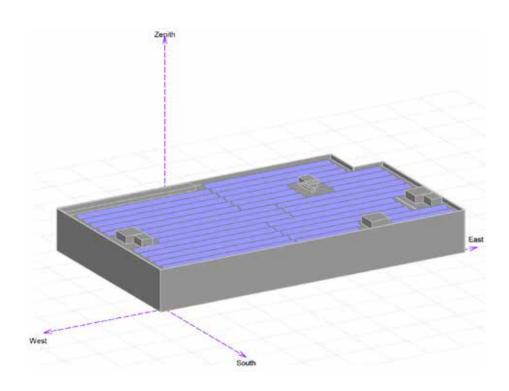

The system, in Amsterdam, The Netherlands, comprises 1,000 \times 300Wp panels. One system was designed with 3 x SE82.8K SolarEdge inverters and 500 \times P700 power optimisers in a 2:1 configuration. The second system was designed with 9 \times 27.6kW traditional string inverters.

The SE82.8K model is a three phase inverter with synergy technology, combining large capacity with reduced installation time and cost. The inverter is based on three small and lightweight units; one primary unit easily connected to two secondary units. Up to 31 inverters can be configured directly from one master inverter for fast commissioning.

Energy comparison

PVsyst was used to simulate the yield of both systems in year 1 and year 20. The SolarEdge advantage is growing with time due to uneven panel aging which increases mismatch between panels.

	Traditional String Inverter	SolarEdge System	SolarEdge Advantage
PVsyst year 1 yield (MWh)	272.3	279.1	2.5%
PVsyst year 20 yield (MWh)	242.9	257.2	5.9%
